Basic Lighting Concept

The concept is to light the faces of the textured panels, the edges of the textured panels, and the face of the lettered signs with RGBW LED Light, to allow for flexibility of the lighting. This along with a proven control system will allow for the custom creation of lighting themes to compliment specific occasions and events.

1. Utilize ground mounted RGBW Flood fixtures with varying beam angles to wash the face of the textured panels with colored light.
2. Utilize ground mounted RGBW spot lights on the narrow edges of the textures panels to wash the ends of the panels. This could provide a contrasting alternate color to the faces of the panels or could match the faces of the panels.
3. Wash the face of the lettered signs with ground mounted RGBW Linear Graze fixtures.
4. Internally illuminate the Lettering.
5. Utilize a proven lighting control system that has been used on other FDOT projects of this nature.
